LECTURE NOTE

SUBJECT NAME- ESTIMATION & COST EVALUATION-I

BRANCH-CIVIL ENGG.

SEMESTER-3RD SEM

ACADEMIC SESSION-2022-23

PREPARED BY- DIBYAJYOTI NAYAK

Estimate: Before undertaking the construction of a project it is necessary to know its probable cost which is worked out by estimating.

An estimate is a computation or calculation of the quantities required and expenditure likely to be incurred on the construction of a work.

The primary object of the estimate is to enable one to know before hand, the cost of the work. The estimate is the probable cost of a work and is determined theoretically by mathematical calculations based on the plans and drawing and current rates. Approximate estimate may be prepared by various methods but accurate estimate is prepared by Detailed estimate method.

Actual cost: The actual cost of a work is known at the completion of the work. Amount of all expenditure is maintained by day-to-day during execution of work in the account section and at the end of the completion of work when the account is completed, the actual cost is known. The actual cost should be not differ much from the estimated cost worked out at the beginning.

An estimate is the anticipated or probable cost of a work and is usually prepared before the construction is taken up. Before undertaking any work or project it is necessary to know its probable cost which is obtained or derived by estimating.

Plinth Area Estimate

A covered built-up area measured at the floor level of any buildings storey or (at the floor level of the buildings basement) is called the plinth area. It is the measure of a building's useable area.

It is also known as the built-up area that is the whole area occupied by the building along with external and internal walls. It is usually 10% to 20% higher than the carpet area.

It should be computed for the enclosed area by measuring the external buildings dimensions at the floor level. The courtyard and other open areas will not include in the plinth area.

Floor Area

Floor area of a building is the total area of floor in between walls and consists of floor of all rooms verandahs passage corridors room, entrance halls, kitchen, stores, bath and latrine (W.C) etc. Sills of doors and openings are not included in the Floor Area.

Floor Area is equal to plinth area minus area occupied by walls.

For deductions of wall area from plinth area to obtain floor area shall include - (i) Door and other openings in the wall, (ii) Intermediate pillars and supports (iii) Plasters along walls exceeding 300 sq.m in area, (iv) Flues with which are within walls.

Circulation Area: Circulation area is the floor area of verandahs, passage, corridors, balconies, entrance hall, porches, staircase, etc. which are used for movements of persons using the building. The circulation area of any floor shall comprise of the following:—

- (a) Verandahs and balconies,
- (b) Passages and corridors,
- (c) Entrance halls,
- (d) staircase and munties,
- (e) shafts for lift.

The circulation area may be divided into two parts: (1) Horizontal circulation area and (2) Vertical circulation area.

Horizontal Circulation Area:

Horizontal area of a building is the area of verandahs, passage, corridors, balconies, porches etc. which are required for the horizontal movement of the users of the building. This may be 10% to 15% of the plinth area of the building.

Vertical Circulation Area:

Vertical circulation area of a building is the area or space occupied by staircases, lifts and the entrance halls adjacent to them which are required for vertical movement of the users of the building. This may be 4% to 5% of the plinth area of the buildings.

Carpet Area:

Carpet Area of building is the useable area or liveable area or lettable area. This is the total floor area minus the circulation area, verandahs, corridors, passages, staircase, lifts, entrance hall, etc. and minus other non-useable areas as sanitary accommodations, air conditioner room etc. For office building carpet area is the lettable area or useable area and for residential building carpet area is the liveable area and should exclude the kitchen, pantry, stores and similar other rooms which are not used for living purposes.

Units of measurements in metric system

Units of dimensions for materials and work

<u>Particulars of Materials and Work</u>	<u>Dimensions metric system</u>
1. Bricks, stone blocks, etc.	→ All dimensions cm
2. Tiles, slates, wall board, glass panes, A.C. sheets, sheets etc.	→ Length and breadth in cm or m. → Thickness in mm
3. Door, windows etc	→ Height and breadth in cm or m
4. Parts of doors and windows as panels shutter	→ cm or mm.
5. Timber	→ Length in m and cross-sectional dimension in cm or mm
6. Masonry (brickwork, stone masonry, etc.)	→ Length and height in m. Thickness or breadth in cm.
7. Cement concrete, Lime concrete, R.C.C. flooring, etc	→ Length and breadth in m
8. White washing, colour washing, Distempers, painting, etc	→ Thickness in cm
9. Aggregates, ballast, grit, sand, etc	→ Length and breadth or height in m.
10. Rolled steel sections as I-beam, channels, angle etc	→ size in mm. → Length in m, section in mm
11. Mild steel bars	→ Length in m, Dia. in mm

Units of measurements and payments bear various items of works and materials

Sl. No.	Particulars of item	Units of measurement in Mks	Units of Payment in Mks	Units of Payment in FPS
<u>Earthwork</u>				
1.	Earthwork in excavation in ordinary soil	cu.m	per cu.m	1 cu.ft
	earthwork in mixed soil with kankar, bajri etc	cu.m	per cu.m	1 cu.ft
	earthwork in hard soil	cu.m	per cu.m	1 cu.ft
2.	Rock excavation	cu.m	per cu.m	1 cu.ft
3.	Earthfilling in excavation in foundation	cu.m	per cu.m	1 cu.ft
4.	Earthfilling in foundation trenches	cu.m	per cu.m	1 cu.ft
5.	Earthfilling in plinth	cu.m	per cu.m	1 cu.ft
6.	Earthwork in banking, cutting in road and irrigation channel	cu.m	per cu.m	1 cu.ft
7.	Surface dressing and levelling, cleaning etc.	sq.m	per sq.m	1 sq.ft
8.	Cutting of trees	no.	per no.	per no.
9.	Puddling, puddle clay core	cu.m	per cu.m	1 cu.ft
10.	Sand filling	cu.m	per cu.m	1 cu.ft
11.	Quarrying of stone or boulders	cu.m	per cu.m	1 cu.ft
12.	Blasting of rock (Blasted stone stacked and then measured)	cu.m	per cu.m	1 cu.ft
<u>Concrete</u>				
1.	Lime concrete in foundation	cu.m	per cu.m	1 cu.ft
2.	Lime concrete in roof terracing, thickness specified	sq.m	per sq.m	1 sq.ft
3.	Cement concrete (C.C)	cu.m	per cu.m	per cu.ft
4.	Reinforced cement concrete (R.C.C)	cu.m	per cu.m	per cu.ft
5.	C.C. or R.C.C. chajja, sunshade	cu.m	per cu.m	per cu.ft
6.	Precast C.C. or R.C.C.	cu.m	per cu.m	per cu.ft
7.	Cement concrete bed	cu.m	per cu.m	per cu.ft
<u>D.P.C</u>				
8.	Damp proof course - cement concrete, Rich cement mortar, Asphalt, etc in cement, lime or mud mortar	sq.m	per sq.m	1 sq.ft
<u>Brickwork:</u>				
1.	Brickwork in foundation and plinth, in superstructure, in arches, etc. in cement lime or mud mortar	cu.m	per cu.m	1 cu.ft
2.	Sundried brickwork	cu.m	per cu.m	1 cu.ft
3.	Honey-comb brickwork, thickness specified	sq.m	per sq.m	1 sq.ft
4.	Brickwork in jack arches, to be measured separately	cu.m	per cu.m	1 cu.ft
5.	Jack arch roofing including top finishing	sq.m	per sq.m	1 sq.ft
6.	Brickwork in well lining	cu.m	per cu.m	1 cu.ft
7.	Half brickwork with or without reinforcement	sq.m	per sq.m	1 sq.ft
8.	Thin partition wall	sq.m	per sq.m	1 sq.ft

S. No	Particulars of Items	Units of measurement in MKS	Units of payment in MKS	Units of payment in FPS
8.	Thin partition wall	sq.m	per sqm	7. sq. ft
9.	Reinforced brickwork (R.B work)	cu.m	per cu.m	7. cu.ft
10.	string course, drip course, weather course, coping etc (projection specified)	metre	per m	per ft
11.	cornice	metre	per m	per ft
12.	Brickwork in fire place, chulla, chimney	cu.m	per cu.m	7. cu.ft
13.	Pergetting chimney, fire place blue	metre	per m	per ft
14.	Brick edging	metre	per m	per ft

Stonework

1.	Stone masonry, Random rubble masonry coursed Rubble masonry, Ashlar masonry in walls, in arches, etc	cu.m	per cu.m	7. cu.ft
2.	Cut stone work in lintel, beam etc.	cu.m	per cu.m	7. cu.ft
3.	Stone slab in roof, shelf, etc. stone chhajja. stone, sun shed etc.	sq.m.	per sq.m.	7. sq.ft
4.	stonework in wall facing or lining	sq.m.	per sq.m.	per sq.ft

Wood work

1.	Wood work, door & window frame or chowkhat, rafters, beams, roof trusses etc.	cu.m	per cu.m	per cu.ft
2.	Door and window shutters or leaves, panelled battens, glazed, part panelled and part glazed wire gauged, etc.	sq.m	per sq.m	per sq.ft
3.	Door and window fittings or hinges or screw bolts sliding bolts, handles etc.	no.	per no.	per no.
4.	Timbering, boarding (Thickness specified)	sq.m	per sq.m	per sq.ft
5.	Timbering of trenches	sq.m	per sq.m	per sq.ft
6.	Sawing of timber	sq.m	per sq.m.	per sq.ft
7.	Woodwork in partition, plywood, etc	sq.m.	per sq.m.	per sq.ft
8.	Balises (Dia. specified)	metre	per m	per ft.

Steel work

1.	Rolled steel joists, channels, Angles, T-irons Flats, squares, rounds, etc	quintal	per q	per cwt
2.	steel reinforcement bars etc. in RCC. R.B. work	quintal	per q	per cwt
3.	Bending, binding of steel reinforcement	quintal	per q	per cwt
4.	Fabrication and hoisting of steel work	quintal	per q	per cwt
5.	Expanded Metal (X.P.M.) size specified	sq.m	per sq.m	per sq.ft
6.	Fabric reinforcement, wire netting	sq.m	per sq.m	per sq.ft
7.	Iron work in stress	quintal	per q	per cwt
8.	Gusset plate (Min ^m rectangular size from wh. cut)	quintal	per q	per cwt
9.	Cutting of Iron joists, channels	cm	per cm	per inch
10.	Threading in iron	cm	per cm	per inch
11.	Cutting angles, Tees, plate	sq.cm	per sq.cm	per sq. inch

12. Welding, solder of sheets, plates	cm	per cm	per inch
13. Boring holes in iron	no.	per no.	per no.
14. Cast Iron (C.I.) pipe, Dia specified	metre	per m	per ft
15. Rivets, Bolts, and nuts, Anchor bolts, Lewis bolts, Holding down bolts, etc.	quintal	per q	per cwt
16. Barbed wire fencing	metre	per m	per ft
17. Iron gate	sq. m	per sq m	per sq ft
18. Iron hold fast	quintal	per q	per cwt
19. Iron railing (Height and type spec)	metre	per m	per ft
20. Iron grill, collapsible gate	sq. m	per sq m	per sq ft
21. Steel doors and windows (type & fixing specified)	sq. m	per sq m	per sq ft
22. Steel door and windows (type and fixing)	sq. m	per sq m	per sq ft

Roofing

1. Tiled roof - Allahabad tile, Faizabad tile, Mangalore tile etc, including battens	Sqm	per sq m	1. sq ft
2. Country tile roof including bamboo jabbu.	sq. m	per sq m	1. sq ft
3. Corrugated iron (G.C.I) roof, Asbestos cement (A.C.) sheet roof	sq. m	per sq. m	1. sq. ft
4. Slate roofing, timber roofing	sq. m	per sq. m	1. sq. ft
5. Mud roof-cover and inclusive of tiles or bricks	sq. m	per sq. m	1. sq. ft
6. Ridges, valleys, gutters	metre	per m	per ft
7. Expansion, contraction or construction joint	metre	per m	per ft
8. Ceiling - Timber, Ac-sheet plain, cloth cement plaster on XPM, puste board etc.	sq. m	per sq m	per sq ft

Plastering, painting and finishing

1. Plastering - cement mortar, lime mortar, mud, etc. (Thickness, proportion specified)	sq. m	per sq. m	1. sq. ft
2. Pointing - struck, Flush, weather etc.	sq. m	per sq. m	1. sq. ft
3. Dado (Thickness and type specified)	sq. m	per sq. m	1. sq. ft
4. Skirting (Thickness type and height specified)	metre	per m	per ft
5. Cement mortar or lime mortar rubbing	sq. m	per sq. m	1. sq. ft
6. White washing, colour washing, cement washing (No. of coat spec)	sq. m	per sq. m	1. sq. ft
7. Distemping (No. of coat specified)	sq. m	per sq. m	1. sq. ft
8. Snow cement washing or finishing	sq. m	per sq. m	1. sq. ft
9. painting, varnishing (No. of coat spec)	sq. m	per sq. m	1. sq. ft
10. polishing of wood work (No. of coat spec)	sq. m	per sq. m	1. sq. ft
11. painting letters and figure (Ht. spec)	no.	per no.	per no.

12. Oiling and clearing of doors and windows	sq.m	per sq.m	7.5 sq.ft
13. Coal painting (No. of coats specified)	sq.m	per sq.m	7.5 sq.ft
14. Removing of paint or varnish	sq.m	per sq.m	7.5 sq.ft
15. Goble Lapping (crowding wash)	sq.m	per sq.m	7.5 sq.ft

Flooring

1. 2.5cm (1") C.C. over 7.5cm (3") L.C. floor (including L.C.)	sq.m	per sq.m	7.5 sq.ft
2. Conglomerate floor, artificial patent stone floor 2.5cm (1") C.C. over 7.5cm (3") L.C. including L.C.	sq.m	per sq.m	7.5 sq.ft
3. 4cm (1½") thick stone floor flag stone floor over 7.5cm (3") L.C. (including L.C.)	sq.m	per sq.m	7.5 sq.ft
4. 2.5cm (1") marble flooring over 7.5cm (3") L.C. (including L.C.)	sq.m	per sq.m	7.5 sq.ft
5. Mosaic or terrazzo or granolithic floor over 7.5cm (3") L.C. (including L.C.)	sq.m	per sq.m	per sq.ft
6. Brick flat floor over 7.5cm (3") L.C. including L.C.	sq.m	per sq.m	7.5 sq.ft
7. Brick on edge floor over 7.5cm (3") L.C. including L.C.	sq.m	per sq.m	7.5 sq.ft
8. 2.5cm (1") or 4cm (1½") G.C. floor	sq.m	per sq.m	7.5 sq.ft
9. Mud flooring finished goble lapping	sq.m	per sq.m	7.5 sq.ft
10. Apron or plinth protection	sq.m	per sq.m	7.5 sq.ft
11. Door and window sill (C.C. or cement mortar plastered)	sq.m	per sq.m	7.5 sq.ft

Method of building estimate

Ex. 1 Estimate the quantities of brickwork and plastering required in a wall 4m long, 3m high and 30cm thick. Calculate also the cost if the rate of brickwork is Rs. 320.00 per cu.m and of plastering is Rs. 8.50 per sq.m.

Ans Quantity of brickwork = $L \times B \times H = 4m \times 3m \times 0.30 = 3.6 \text{ cu.m}$

Quantity of plastering (two faces) = $2 \times L \times H = 2 \times 4m \times 3m = 24 \text{ sq.m}$

cost of brickwork = $3.6 \times 320.00 = \text{Rs. } 1152.00$

cost of plastering = $24 \times 8.50 = \text{Rs. } 204.00$

Total cost = $1152.00 + 204.00 = \text{Rs. } 1356.00$

Ex. 2 Prepared a detailed estimate of part of a wall of a building from the given plan and section and general specification (fig 2.1 and 2.2)

General specifications

- (1) Foundation concrete shall be of lime concrete
- (2) Foundation and plinth shall be of 1st class brickwork in lime mortar
- (3) Damp proof course - 2.5mm c.c. 1:1½:3 with water proofing compound
- (4) Superstructure - 1st class brickwork in lime mortar
- (5) Wall finishing. Inside wall 12mm cement plaster of 1:6 and white wash 3 coats.

Plan and Section

Fig. 2-1

WALL WITH STANDARD MODULAR BRICKS.

Fig. 2-2

WALL WITH TRADITIONAL BRICKS.

Outside wall 12mm cement plastered 1:6 including 10cm below ground level and finished with 2 coat of colour wash over one coat of white washing.

Method of building estimate

Method 1

Separate or individual wall method - In this method, measure or find out the external length of walls running in the longitudinal direction generally the long walls out-to-out, and the internal lengths of walls running in the transverse direction in-to-in i.e. of cross or short wall in-to-in and calculate quantities multiplying the length by the breadth and the height of wall.

Long wall length out-to-out = centre to centre length + half breadth on one offside + centre to centre length of one breadth.
 Short wall length in-to-in = centre to centre length - one breadth.

Ex. 3(a) Fig 23, the plan represents the plan of superstructure wall of a single room building of 5m x 4m, and sections represent the cross-sections of the walls with foundation.

Estimate the quantities of -

- (1) Earthwork in excavation in foundation,
- (2) Concrete in foundation.
- (3) Brickwork in foundation and plinth and
- (4) Brickwork in superstructure.

The length of long wall centre to centre = $5.00 + \frac{1}{2} \times 0.30 + \frac{1}{2} \times 0.30 = 5.30m$.

The length of short wall centre to centre = $4.00 + \frac{1}{2} \times 0.30 + \frac{1}{2} \times 0.30 = 4.30m$

Item No.	Particulars of item	No.	Length in m	Breadth in m	Height or Depth in m	Quantity	Explanatory note
1.	Earthwork in excavation in foundation - Long wall	2	6.20	0.90	0.90	10.04	L = 5.3 + 0.9 = 6.20m L = 4.30 - 0.90 = 3.40m
	Short wall	2	3.40	0.90	0.90	5.51	
	Total					15.55 cu.m	
2.	Concrete in foundation - Long wall	2	6.20	0.90	0.30	3.35	Length same as excavation quantity
	Short wall	2	3.40	0.90	0.30	1.83	
	Total					5.18 cu.m	
3.	Brickwork in foundation and plinth - Long wall - 1st booting	2	5.90	0.60	0.30	2.13	L = 5.3 + 0.6 = 5.90m L = 5.3 + 0.5 = 5.80m L = 5.3 + 0.4 = 5.70m L = 4.3 - 0.60 = 3.70m L = 4.30 - 0.50 = 3.80m L = 4.3 - 0.40 = 3.90m

Ex. 5(a) Estimate the quantities of the following items of a residential building from the given drawing (Fig 2.7).

- (1) Earthwork in excavation in foundation.
- (2) Lime concrete in foundation.
- (3) First class brickwork 1:6 cement sand mortar in foundation and plinth.
- (4) 2.5cm Damp proof course.
- (5) First class brickwork in lime mortar in superstructure.

Ans Drawing and left hand side bed room combined -
 c. to c. long walls = $6.00 + 1.00 + 0.30 + 2 \times 0.15 = 10.60\text{ m}$
 c. to c. short walls = $5.00 + 2 \times 0.15 = 5.30\text{ m}$.

Bedrooms right side (both combined)
 c. to c. long walls = $5.00 + 1.00 + 0.30 + 2 \times 0.15 = 9.60\text{ m}$
 c. to c. short walls = $4.50 + 2 \times 0.15 = 4.80\text{ m}$

Front Verandah
 Front wall c. to c. length = $5.00 + 1.00 + 2 \times 0.3 + \frac{0.30}{2} - \frac{0.20}{2} = 9.65\text{ m}$
 side wall c. to c. length = $2.00 + \frac{0.30}{2} + \frac{0.20}{2} = 2.25\text{ m}$

Back verandah including bath room
 c. to c. long wall (rear wall including bath room) 9.65m same as front verandah
 c. to c. length of side wall of bath room = $2.50 + \frac{0.30}{2} + \frac{0.20}{2} = 2.75\text{ m}$

- Doors:-**
 $D_1 - 120 \text{ cm} \times 210 \text{ cm} (1.20 \text{ m} \times 2.10 \text{ m})$
 $D_2 - 100 \text{ cm} \times 200 \text{ cm} (1.00 \text{ m} \times 2.00 \text{ m})$
 $D_3 - 75 \text{ cm} \times 180 \text{ cm} (.75 \text{ m} \times 1.80 \text{ m})$
- Windows:-**
 $W_1 - 100 \text{ cm} \times 150 \text{ cm} (1.00 \text{ m} \times 1.50 \text{ m})$
 $W_2 - 200 \text{ cm} \times 150 \text{ cm} (2.00 \text{ m} \times 1.50 \text{ m})$
 $W_3 - 75 \text{ cm} \times 120 \text{ cm} (.75 \text{ m} \times 1.20 \text{ m})$
 $C.W. - 75 \text{ cm} \times 60 \text{ cm} (.75 \text{ m} \times .60 \text{ m})$
- Shelves:-**
 $S - 100 \text{ cm} \times 150 \text{ cm} (1.00 \text{ m} \times 1.50 \text{ m})$
 Lintel Over Doors, Windows Etc.
 15 cm R.B.

All walls of Drawing Rooms and Bed Rooms have same section
 Bath Room walls have similar section.

Note— No beam has been shown in the plan.

			Net total			66.59 cu.m	

METHOD-II

Centreline method: In this method known as centre line method sum-total length of centre lines of walls, long and short, has to be found out. Find the total length of centre lines of walls, of same type, long and short having same type of foundations and footing and then find the quantities by multiplying the total centre length by the respective breadth and the height.

In this method, the length will remain same for excavation in foundation, for concrete in foundation, for all footings and for superstructure. This method is quick but requires special attention and consideration at the junctions, meeting points of partitions or cross walls, etc.

For rectangular, circular polygonal (hexagonal, octagonal, etc.) building having no interior cross walls, this method is quite simple. For buildings having cross or partition walls, for every junction of partition or cross wall with main walls, special consideration shall have to be made to find the correct quantity. For each junction half breadth of -respective item or footing is to be deducted from the total centre lengths.

Ex 3(b) Estimate by centre line method the quantities of the following items of a single room building Fig 2.3

- (1) Earthwork in excavation in foundation,
- (2) Concrete in foundation,
- (3) Brickwork in foundation and plinth
- (4) Brickwork in superstructure

Ans Total centre length of walls = $5.30 + 4.30 + 5.30 + 4.30 = 19.20 \text{ m}$.

No.	Particulars of item	No.	Length in m	Breadth in m	Height in m	Quantity	Explanatory notes
1.	Earthwork in excavation in foundation	1	19.20	0.90	0.90	15.55 cu.m	Total centre length of all walls = 19.20 m
2.	Concrete in foundation	1	19.20	0.90	0.30	5.18 cu.m	
3.	Brickwork in foundation and plinth						
	1st footing	1	19.20	0.60	0.30	3.46	
	and footing	1	19.20	0.50	0.30	2.88	
	plinth wall	1	19.20	0.40	0.60	4.61	
					Total:	10.95 cu.m	
4.	Brickwork in superstructure	1	19.20	0.30	3.50	20.16 cu.m	Door and window openings, lintels, etc. to be deducted.

Ex 4(b) Estimate by centre line method the quantities of the following items of a two roomed building Fig 2.6.

- (1) Earthwork in excavation in foundation
- (2) Lime concrete in foundation
- (3) 1st class brickwork in cement mortar 1:6 foundation and plinth
- (4) 2.5cm c.c. damp proof course, and
- (5) 1st class brickwork in lime mortar in superstructure

Ans There are 2 junctions of the inter wall with the main wall.

$$\begin{aligned} \text{Total centre length of wall} &= 2 \times \text{c. to c. of long wall} + 3 \times \text{c. to c. of short wall} \\ &= 2 \times 10.60 + 3 \times 6.30 = 40.10 \text{ m} \end{aligned}$$

Ex 5 (b) Estimate by centre line method the quantities of the following items of a residential building, Fig 2.7 (b)

- (1) Earthwork in excavation in foundation
- (2) Lime concrete in foundation
- (3) First class brickwork in 1:6 cement sand mortar in foundation and plinth
- (4) Damp proof course and
- (5) First class brickwork in lime mortar in superstructure.

Ans Total centre length of all 30 cm walls (same type) of main rooms
= Total centre length of walls of drawing and 1st side bed room
+ Total centre length of walls of bed rooms (right side
= (2 x c. to c. length of long wall + 3 x c. to c. length of short wall)
+ (2 x c. to c. length of long wall + 2 x c. to c. length of short wall)
= (2 x 10.60 + 3 x 5.30) + (2 x 9.60 + 2 x 4.80)
= 37.10 + 28.80 = 65.90 m.

Number of junctions for these walls is 6 marked 'x' in the plan Fig 2.7., all these junctions are with main walls of 30 cm.
Total centre length of all 30 cm walls of front verandah, back verandah and bath room

= (c. to c. length of front wall + c. to c. length of side wall) + (c. to c. length of back verandah long wall including bath) + 2 x c. to c. length of cross walls of bath room
= (9.65 + 2 x 2.25) + (9.65 + 2 x 2.75) = 11.90 + 15.15 = 27.05 m.

Item No.	Particulars of item	No.	Length in m	Breadth in m	Height in m	Quantity	Explanatory Note
7.	Earthwork in excavation in foundation — wall of main room (six junctions)	1	63.20	0.90	1.00	56.88	$L = 65.90 - 6 \times \frac{0.90}{2} = 63.20 \text{ m}$
	walls of verandah including bath (five and one junctions)	1	24.50	0.60	0.50	7.35	$L = 27.05 - 5 \times \frac{0.60}{2} - 1 \times \frac{0.60}{2} = 24.50 \text{ m}$
					Total	64.23 cu.m	

RESIDENTIAL BUILDING

- Doors:-**
 D₁ - 120 cm × 210 cm (1.20 m × 2.10 m)
 D₂ - 100 cm × 200 cm (1.00 m × 2.00 m)
 D₃ - 75 cm × 180 cm (.75 m × 1.80 m).
- Windows:-**
 W₁ - 100 cm × 150 cm (1.00 m × 1.50 m)
 W₂ - 200 cm × 150 cm (2.00 m × 1.50 m)
 W₃ - 75 cm × 120 cm (.75 m × 1.20 m)
 C.W. - 75 cm × 60 cm (.75 m × .60 m).
- Shelves:-**
 S - 100 cm × 150 cm (1.00 m × 1.50 m)
 Lintel Over Doors, Windows Etc.
 15 cm R.B.

All walls of Drawing Rooms and Bed Rooms have same section
 Bath Room walls have similar section.
Note—No beam has been shown in the plan.

Fig. 2-7

Particulars of item	No.	L	B	H	Q	Ex. note	
1. Lime concrete in foundation							
Walls of main rooms	1	63.21	0.90	0.30	17.06	Length same as earthwork - excavation $L = 27.05 - 5 \times \frac{0.50}{2} - 1 \times \frac{0.60}{2}$ $= 25.50 \text{ m}$ (Minus half breadth per junction at the same level)	
Walls of verandah and bath	1	25.50	0.60	0.20	2.06		
					Total = 19.12		
2. 1st class brickwork on foundation and plinth in 1:6 cement mortar -							
Walls of main rooms -							
1st footing	1	64.10	0.60	0.20	7.69	$L = 65.90 - 6 \times \frac{0.60}{2} = 64.10 \text{ m}$	
2nd footing	1	64.40	0.50	0.20	6.44	$L = 65.90 - 6 \times \frac{0.50}{2} = 64.40 \text{ m}$	
plinth wall above footing	1	64.70	0.40	0.90	23.29	$L = 65.90 - 6 \times \frac{0.40}{2} = 64.70 \text{ m}$	
Walls of verandah and bath -							
footing	1	25.85	0.40	0.20	2.07	$L = 27.05 - 5 \times \frac{0.40}{2} - 1 \times \frac{0.40}{2}$ $= 25.95 \text{ m}$	
plinth wall above footing	1	25.90	0.30	0.70	5.44	$L = 27.05 - 5 \times \frac{0.40}{2} - 1 \times \frac{0.30}{2}$ $= 25.90 \text{ m}$	
					Total = 41.93		
4. 2.5cm Damp proof course							
Walls of main rooms	1	64.70	0.40	-	25.88		
Verandah pillars	1	0.50	0.30	-	0.60		
Bathrooms (total of 2 walls)	1	7.30	0.30	-	2.19	$L = (2.20 + 2 \times 0.15) + 2 \times (2.75 - \frac{0.4 + 0.3}{2})$ $= 7.30 \text{ m}$	
					Total = 28.67		
Deduct door sill					same as per detailing	3.91	Deduction of usual
					Net Total = 24.7659 mt		
5. 1st class brick-work in super-structure in lime mortar -							
Walls of main rooms	1	65.00	0.30	1.00	78.00	$L = 65.90 - 6 \times \frac{0.30}{2} = 65.10 \text{ m}$	
Walls of verandah and bath (as solid)	1	26.20	0.20	5.05	15.98	$L = 27.05 - 5 \times \frac{0.30}{2} - 1 \times \frac{0.20}{2}$ $= 26.20 \text{ m}$	
					Total = 93.98		
Deduct openings and lintels					same as deduct.	27.40	Deduct deduction as usual.
					Net Total = 66.58		
					(cu.m)		

Arch calculations:

The quantities of masonry work in arch is calculated by multiplying the mean length of arch by breadth of wall and by the thickness of arch. In the case of culvert the quantity of arch masonry work is equal to the length of arch base to base \times mean length of arch \times thickness of arch.

Case I Segmental Arch with span and angle given - Arch of span S subtending an angle θ at the centre

S = span, θ = angle at the centre, r = radius
 r_m = mean radius
 l_m = mean length of arch, t = thickness of arch,
 b = breadth of wall

$\sin \frac{\theta}{2} = \frac{S/2}{r}$
 $\therefore r = \frac{S}{2} \times \frac{1}{\sin \frac{\theta}{2}}, r_m = r + \frac{t}{2}$
 $\frac{l_m}{2\pi r_m} = \frac{\theta}{360}, \therefore l_m = 2\pi r_m \times \frac{\theta}{360}$

l_m can be found
Quantity of arch masonry work Q = mean length of arch \times breadth of wall \times thickness of arch
 $= l_m \times b \times t$

ex 1 An arch of 2.50m span subtends an angle of 60° at the centre. The thickness of arch is 30cm and the breadth of wall is 40cm. Calculate the quantity of arch masonry work.

Ans Radius $r = \frac{s}{2} \times \frac{1}{\sin 45^\circ} = \frac{2.50}{2} \times \frac{1}{0.7071} = 1.768 \text{ m}$

Mean radius $r_m = r + \frac{t}{2} = 1.768 + \frac{0.30}{2} = 1.918 \text{ m}$

Mean length of arch $l_m = 2\pi r_m \times \frac{\theta}{360} = 2 \times \frac{22}{7} \times 1.918 \times \frac{60}{360} = 2.93 \text{ m}$

Quantity of arch masonry = $l_m \times \text{breadth of wall} \times \text{thickness of arch}$
 $= 2.93 \times 0.40 \times 0.30 = 0.352 \text{ cu.m.}$

Case II Segmental Arch of 60° Arches over doors and windows are usually segmental subtending an angle of 60° at the centre. 60° arch forms an equilateral on the span with radii

l_m = mean length of arch, r_m = mean radius

s = span r = radius

$r = s$ and $r_m = r + \frac{t}{2}$, $\frac{1}{2\pi r_m} = \frac{60^\circ}{360^\circ} = \frac{1}{6}$

$l_m = \frac{1}{6} \times 2\pi r_m = \frac{1}{3}\pi r_m$, l_m can be found

Quantity $Q = l_m \times \text{breadth of wall} \times \text{thickness of arch}$
 $= l_m \times b \times t$

ex 2 Calculate the quantity of brickwork in a 60° arch over a door of 1.20m width. The arch is 20cm thick and the thickness of the wall is 30cm.

Ans $r = 1.20 \text{ m}$, $r_m = r + \frac{t}{2} = (1.20 + \frac{0.20}{2}) = 1.30 \text{ m}$

$l_m = \frac{1}{3}\pi r_m = \frac{1}{3} \times \frac{22}{7} \times 1.30 = 1.36 \text{ m}$

Breadth of wall $b = 0.30 \text{ m}$, Thickness of arch $t = 0.20 \text{ m}$

$\therefore Q = l_m \times b \times t = 1.36 \times 0.30 \times 0.20 = 0.082 \text{ cu.m.}$

Arch masonry, lintels over openings are all deduction works

Plastering and pointing

Plastering usually 12mm ($\frac{1}{2}$ ") thick is calculated in sq.m. For walls the measurement are taken for the whole face of the wall for both sides as solid, and deductions for openings are made in the following manner -

- (i) No deduction is made for ends of beams, joists, rafters, etc.
- (ii) For small opening upto 0.5 sq.m (5 sq.ft) no deduction is made, and at the same time no additions are made for jambs, soffits and sills of these openings.
- (iii) For openings exceeding 0.5 sq.m (5 sq.ft) but not exceeding 3 sq.m (30 sq.ft) deduction is made for one face only, and the other face is allowed for jambs, soffits and sills which are not taken into account separately.
- (iv) For openings above 3 sq.m (30 sq.ft) deduction is made for both faces of the opening, and the jambs, soffits and sills are taken into account and added.

As the outer jambs, etc. are much smaller than the inner ones, the deduction is usually made.

For the deduction for arch opening the same principle as for masonry work is followed.

Plastering of ceiling usually 12mm ($\frac{1}{2}$ ") thick is computed in sq.m under a separate head as this work is done with richer mortar. For R.C.C. work

usually no plastering is allowed but bare bare finish a thin plaster of rich cement mortar may be allowed which should not be taken in the measurements separately. Then rich cement mortar plastering in R.C.C. work may also be taken under a separate item, specially in the ceiling inside room.

Pointing: Pointing in walls is calculated in sq.m for whole surface and deductions similar to plastering are made.

White-washing or Colour-washing or Distemping:

The quantities are computed in sq.m and are usually same as for plastering. The inside is usually white washed or distemped and this item will be same as for inside plaster. The outside is colour-washed and the quantities of the colour-washing will be same as for outside plaster. These item need not be calculated separately, but simply written as same as for inside plaster or outside plaster. Number of coats of white washing or colour-washing are taken as one job or work and the rate cover for the number of coats which should not be a multiplying factor. The number of coats should be mentioned in this item. Deductions are dealt in the same manner as for plastering. Other types of surface finishing may also be done and may be taken accordingly.

Painting: Painting or Varnishing of doors and windows are computed in sq.m, the dimensions should be taken for outer dimensions of the chowhat i.e. outer dimensions of doors and windows. The area is measured flat. No separate measurement is taken for the chowhat, the area is same as the area of wall opening. For iron bars, grills etc. the area of the clear opening inside the chowhat is taken. For both faces of doors and windows, the simple area as measured above is multiplied by appropriate numbers as below.

- (i) Panelled, bramed and braced ledged and battened or ledged battened and braced → 2 1/2 times one surface area, for both sides
- (ii) Fully glazed or gauge → 1 times one surface area, for both sides
- (iii) Partly panelled and partly glazed or gauge → 2 times one surface area, for both sides
- (iv) Flush door → 3 times one surface area, for both sides
- (v) Venetian → 3 times one surface area, for both sides
- (vi) Iron bars, grills in windows → 1 times the area of clear opening in between chowhat for overall.

This covers also for chowhats on 3 braces. Painting is done in two or three coats.

is very small, the deduction

usually over a coat or priming. The rates covers both the numbers of coats under one item. The numbers of coats should be mentioned.

The concealed surface of the chowkhat which is in contact with the jamb of the wall is usually painted with two coats of coal tar or solignum and this item is computed separately.

For beams, rafters, purlins, posts, etc. if timber or iron, the area of actual exposed surface is taken for painting.

Corrugated surface is taken as flat and a percentage increase is allowed.

Example Prepare a detailed estimate of a single room building having a front verandah from the given plan, elevation and sectional drawing (Fig 3.1). General specifications are as follows

Foundation and plinth - First class brickwork in 1:6 cement and local sand mortar over lime concrete, 2cm DPC of 1:2 cement mortar mixed with standard water proofing material.

Superstructure - Walls shall be of first class brickwork in lime mortar. Inside and outside walls shall be 12mm plastered with 1:1:6 cement : lime : sand, ceiling shall be 12mm 1:3 cement plastered. Inside shall be white washed three coats and outside shall be colour washed one coat over two coats of white washing.

Door and windows - Door and window chowkhats shall be of salwood and shutters shall be 4cm panelled of deodar wood, and painted two coats over one coat of priming.

Sol Centre to centre length of walls -

Long wall c. to c. length = $4.20 + 0.30 = 4.50m$

Short wall c. to c. length = $3.00 + 0.30 = 3.30m$

Verandah front c. to c. length = $4.20 + 0.30 = 4.50m$

Verandah side c. to c. length = $2.00 + 0.30 = 2.30m$

ESTIMATING AND COSTING

TWO-ROOM BUILDING WITH FRONT VERANDAH

Fig. 3-5

CROSS-SECTION OF TWO-ROOMED BUILDING

SEC^{NL} ELEVATION ON CEF G

Fig. 3-6

Prepare a detailed estimate of a two roomed building with front verandah from the given drawings - plan, elevation, etc. (Fig. 3-5 and 3-6). Calculate also the plinth Area Rate. The General Specifications are as follows:

Foundation and plinth - 1st class brickwork in 1:6 cement mortar over lime concrete damp proof course (D.P.C.) - 2cm thick cement mortar 1:6 with 1.00 kg of composed per bag of cement

Superstructure - 1st class brickwork in lime mortar. All lintel shall be R.B.

Roof - Lime concrete terracing over R.C.C. slab with an insulation layer of sand and clays in between.

Flooring - 2.5cm thick c.c. 1:2:4 over 8cm thick lime concrete, over well rammed earth, surface neat cement finished. Sills of doors and verandah openings shall have only 2.5cm c.c. floor.

Plastering and finishing - Inside and outside walls 12mm thick plastered with 1:1:6 cement:lime:sand mortar. steps 20mm thick cement plastered 1:3 and neat cement finished. R.C.C. work in sun-shade and chhajjas should be fair and smooth finished without any extra payment. Inside white washed 3 coats and outside colour washed 2 coats over 1 coat of white washing.

Door and windows - Chowkhat (frame) shall be of well seasoned sal wood. shutters shall be 4cm thick panelled of Indian teak wood c.s window shutters shall be 4cm thick glazed. Door and window shall be painted 2 coats over 1 coat of priming. Back of chowkhat shall be painted with 2 coats of solignum.

Miscellaneous item - Windows shall be provided with 76mm dia mild steel bars. Necessity iron hold fasts shall be provided in doors and windows. 4 nos. round water spouts of 10cm dia. C.I. pipe 1cm long each shall be provided.

Centre to centre lengths

Room Long walls = $3.50 + 4.00 + 0.30 + (2 \times \frac{0.30}{2}) = 8.10$ m combined total length

Room short walls = $4.00 + (2 \times \frac{0.30}{2}) = 4.30$ m

Verandah front - Extreme outer length at plinth - $(2 \times \frac{0.30}{2})$
 $= \{ 3.50 + 4.00 + (3 \times 0.30) + (2 \times 0.05) \} - 0.30 = 8.20$ m

Verandah sides = $2.50 + \frac{0.30}{2} + \frac{0.30}{2} = 2.75$ m.

Estimate of a 2 roomed building with front & back verandah.

Ex. 6 The plan and sectional elevation of a building are given in Fig 3.7. Estimate the quantities of the following items of work of the building.

(1) Earthwork in excavation in foundation, (2) Lime concrete in foundation, (3) 1st class brickwork in lime mortar in foundation and plinth, (4) Damp proof course, (5) 1st class brickwork in 1:6 cement mortar in superstructure including parapet, (6) R.C.C. work in roof slabs, lintels, sunshade etc. (7) steel reinforcement bars in R.C.C. work at 1%.

Ans. Centre to centre lengths of two adjoining rooms (3.6 x 4.5m room and 3.6 x 4.2m room) combined.

Long walls - 9.20m, short walls - 3.90m

square room - (3.6 x 3.6m room)

Long walls - 3.90m, short walls - 3.90m

Verandah Centre to centre of 30cm wall and 30cm sq pillar -

Front verandah (1.20m ver.)

Long wall (Front) - 3.90m, short wall (side) - 2.50m

Back verandah (2.50m ver.)

Long wall (Back) - 3.90m, short wall (side) - 2.70m

THREE ROOMED BUILDING WITH FRONT AND BACK VERANDAH

Three room building with front and back verandah

Centerline method

- (i) Total centreline length of all 30cm walls - Total centreline lengths of two long walls and two outer short walls of the right side rooms (combined) and of the three walls of the remaining room (square room) = $(2 \times 9.20 + 2 \times 3.90) + (3 \times 3.90) = 37.90$ mt.
Number of junctions are 2 with 30cm walls.
- (ii) Total centreline length of 20cm interval = 3.90 mt.
Number of junctions are 2 with 30cm walls.
- (iii) Total centreline length of all 20cm walls of front and back verandah = Total centreline length of the front verandah long wall and side wall and of the back verandah long wall and side wall = $(3.90 + 2.00) + (3.90 + 2.70) = 12.50$ m.
Number of junctions are 8 (4 with 30cm walls and 4 with 30cm pillars)
- (iv) Total length of parapet wall over outer walls of right side rooms and over outer walls of square room = Right side long wall + front and back outer walls + (walls by the right side of front and back verandah) + (outer walls of square room + front and back walls of square room) = $(9.50 + 2 \times 4.00 + 2.40 + 2.50) + (4.20 + 2 \times 2.90) = 22.40 + 12.00 = 34.40$ m

CROSS SECTION OF WALL THROUGH DOOR

Fig. 3-11

Q. The plan and part cross-section of a hexagonal room are given in (Fig 3.11). Estimate the quantities of - (1) Earthwork in excavation in foundation, (2) Lime concrete in foundation, (3) 1-class brickwork in foundations and plinth in lime mortar, (4) Damp proof course, (5) 1-class brickwork in superstructure in lime mortar, (6) R.C.C. work in roof including chhajja and lintels, (7) Lime concrete in roof terracing, (8) 2.5cm c.c. over 7.5cm L.C. floor and (9) 12mm cement plastering 1:6 inside and outside walls.

Ans. The length of the centre line and the area of the hexagonal may be calculated as below. Fig 3.12. represents $\frac{1}{6}$ th of the hexagon. The sides of a hexagonal form equilateral triangles at the centre.

$$\text{Length of centre line of one side } l_m = 3.00 + 2 \times \frac{0.20}{\tan 60^\circ} = 3.00 + 2 \times \frac{0.20}{1.732} = 3.23 \text{ m}$$

$$\text{Therefore, total length of centre lines} = 6 \times 3.23 = 19.38 \text{ m}$$

$$\text{outer length of superstructure wall } l_1 = 3.00 + 2 \times \frac{0.40}{\tan 60^\circ} = 3.00 + 2 \times \frac{0.40}{1.732} = 3.46 \text{ m}$$

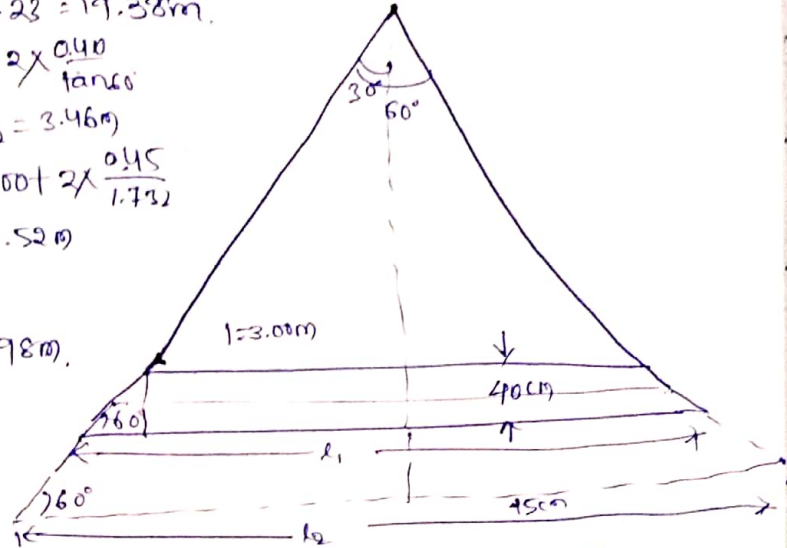

$$\text{outer length of plinth wall} = 3.00 + 2 \times \frac{0.15}{\tan 60^\circ} = 3.00 + 2 \times \frac{0.15}{1.732} = 3.52 \text{ m}$$

$$\text{outer length of chhajja } l_2 = 3.00 + 2 \times \frac{0.85}{\tan 60^\circ} = 3.00 + 2 \times \frac{0.85}{1.732} = 3.98 \text{ m}$$

Floor area: 6 x area of one inside triangle

$$= 6 \times \left(\frac{1}{2} \times \text{base} \times \text{altitude} \right) = 6 \times \left(\frac{1}{2} \times 3.00 \times 3.00 \times \frac{1}{2} \times \tan 60^\circ \right) = 6 \times \left(\frac{1}{2} \times 3 \times 3 \times \frac{1}{2} \times 1.732 \right) = 23.38 \text{ sq. m}$$

$$\text{Roof area} = 6 \times \text{area of one outside triangle} = 6 \times \left(\frac{1}{2} \times 3.46 \times 3.46 \times \frac{1}{2} \times 1.732 \right) = 31.10 \text{ sq. m}$$

SLOPING ROOF

sloping roof may be of -

- (1) Galvanized Corrugated Iron sheet (G.C.I. sheet)
- (2) Asbestos cement sheet (A.C. sheet)
- (3) Tiles
- (4) Timber
- (5) Planks, Thatch, and
- (6) Slate

Q.2 Prepare a detailed estimate of the verandah roof of a building from the given plan and sectional drawing (Fig 4.5). The verandah roof consists of 24 B.G. G.I. sheet supported over salwood rafters and purlins. Woodwork shall be painted two coats over one coat of priming. Assume suitable rates.

Ans Length of rafter, hip rafter and jack rafter may be calculated as below.

Rafter - Fig 4.5 (a)
 Length of rafter = $\sqrt{3.15^2 + 1.05^2} = \sqrt{11.02} = 3.32 \text{ m}$

Adding 15 cm box incision into wall length of rafter comes to 3.47 m. sloping breadth of G.I. sheet roof is $3.32 \text{ m} + 15 \text{ cm} = 3.37 \text{ m}$ (5 cm outer projection) beyond end of rafter.

Hip rafter - Fig 4.5 (b)
 Length of hip rafter = $\sqrt{3.15^2 + 3.32^2} = \sqrt{20.94} = 4.58 \text{ m}$

Adding 15 cm box incision into wall the length of hip rafter comes to 4.73 m.

Length of ridge (5 cm incision into wall and 3 cm outer projection) = $4.58 + 0.05 + 0.05 = 4.68 \text{ m}$

Jack rafter - Fig 4.5 (ii)

$$\frac{L}{3.32} = \frac{2.45}{2.15}$$

$$L = 3.32 \times \frac{2.45}{2.15} = 3.58 \text{ m}$$

Length of rafter is 3.58 m.

Analysis of Rates:

The determination of rate per unit of a particular item of work, viz. the cost of quantities of materials, the cost of labourers and other miscellaneous petty expenses required for its completion is known as the analysis of rate. A reasonable profit usually 10% for the contractor is also included in the analysis of rate. Rates of materials are usually taken as the rates delivered at the site work and include the basic cost, cost of transport, railway freight if any, taxes etc. If the materials are to be carried from a distant place, more than 8 kms (8 miles), then cost of transport is also added. The rates of materials and labour vary from place to place and therefore, the rates of different items of work also vary from place to place.

For the purpose of analysis, the details about all the operations involved in carrying out the work should be available, the quantities of materials required and their costs should be known, and the number of different categories of labourers required and the capacity of doing work per labourer and their wages per day should be known. These can be known only from experience of practical works.

Overhead costs: Overhead costs include general office expenses, rent, taxes, supervision and other costs which are indirect expenses and not productive expenses on the job. The miscellaneous expenses on overheads may be under the following heads:

A. General overheads:

- (i) Establishment (office staff)
- (ii) Stationary, printing, postages, etc.
- (iii) Travelling expenses
- (iv) Telephone
- (v) Rent and taxes.

B. Job overhead

- (a) Supervision (Salary of Engineers, Overseers, Supervision, etc.)
- (b) Handling of materials
- (c) Repairs, carriage and depreciation of T. and F.
- (d) Amenities of labour.
- (e) Workmen's compensation, insurance, etc.

- (f) Interest on investment
- (g) Losses on advances

The contractor may be allowed a net profit of 6 to 8%, and the miscellaneous overhead expenses may come to about 5 to 10%. Find overhead expenses and contractor's profit 15% at the actual cost may be reasonable amount but it is usual practice to add 10% percent for all these under the head profit. For small works overhead cost may be very little.

The analysis of rate is usually worked out for the unit of payment of the particular item of work under two heads -

- (a) Materials and
- (b) Labour

Task - The capacity of doing work by an artisan or skilled labour in the form of quantity of work per day is known as the task-work or out-turn of the labour.

The following may be taken as the approximate quantity of work or out-turn or task for an average artisan per day

Particulars of item,	Quantity	Per day
1. Brickwork in lime or cement mortar in foundation and plinth	1.25 cu.m	(45 cuft) per mason
2. - DO - in superstructure	1.00 cu.m	(35 cuft) per mason
3. Brickwork in mud mortar in foundation and plinth	1.50 cu.m	(55 cuft) per mason
4. - DO - in superstructure	1.25 cu.m	(45 cuft) per mason
5. Brick in cement or lime mortar in arches	0.55 cu.m	(45 cuft) per mason
6. - DO - in jack arches	0.55 cu.m	(20 cuft) per mason
7. Half brick wall in partition	5.00 sq.m	(50 sqft) per mason
8. Coursed rubble stone masonry in lime or cement mortar including dressing	0.80 cu.m	(30 cuft) per mason
9. Random rubble stone masonry in lime or cement mortar	1.00 cu.m	(35 cuft) per mason
10. Ashlar masonry in lime or cement mortar	0.40 cu.m	(15 cuft) per mason
11. Stone arch work	0.40 cu.m	(15 cuft) per mason
12. Lime concrete in foundation or floor	8.50 cu.m	(300 cuft) per mason
13. Lime concrete in roof terracing	6.00 cu.m	(200 cuft) per mason
14. Cement concrete 1:2:4	5.00 cu.m	(175 cuft) per mason
15. R.B. work	1.00 cu.m	(35 cuft) per mason
16. R.C.C. work	3.00 cu.m	(125 cuft) per mason
17. 12mm (1/2") plastering with cement or lime mortar	8.00 sq.m	(80 sqft) per mason
18. pointing with cement or lime mortar	10.00 sq.m	(100 sqft) per mason
19. White washing or colour washing 3 coats	70.00 sq.m	(700 sqft) per white washer
20. White washing or colour washing 1 coats	200.00 sq.m	(2000 sqft) per white washer
21. Painting or varnishing doors or windows one coat	25 sq.m	(250 sqft) per painter.
22. coal tarring or solignum painting one coat	35.00 sq.m	(350 sqft) per painter
23. painting large surface one coat	35.00 sq.m	(350 sqft) per painter.
24. Distemping one coat	35.00 sq.m	(350 sqft) per painter.
25. 2.5cm (1") C.C. floor	7.50 sq.m	(75 sqft) per painter.
26. Flagstone floor laying with lime or cement mortar excluding L.C.	10.00 sq.m	(100 sqft) per painter.
27. Terrazzo floor 6mm thick mosaic work over 2cm thick cement concrete (1:2:4)	5.00 sq.m	(50 sqft) per mason
28. Bridge-on-edge in floor lime or cement mortar excluding L.C.	7.00 sq.m	(70 sqft) per mason
29. Brick flat floor as in above	8.00 sq.m	(80 sqft) per mason
30. Timber bracing sal or teak wood	0.07 cu.m	(2.5 cuft) per Carpenter
31. - DO - country work wood	0.15 cu.m	(5 cuft) per Carpenter

Particulars of item	Quantity	Per day
32. Door and window shutters panelled or glazed	0.15 sqm	(1.5 sqft) per carpenter
33. - DO - battened	0.20 sqm	(2 sqft) per carpenter
34. Sawing hard wood	1.00 sqm	(40 sqft) per pair of sawers
35. Sawing of soft wood	6.00 sqm	(60 sqft) per pair of sawers
36. Single Allahabad tiling or Mangalore tiling	6.00 sqm	(60 sqft) per tile layer
37. Double Allahabad tiling	1.00 sqm	(40 sqft) per tile layer
38. Breaking of brick ballast 40mm (1½") gauge	0.75 cum	(30 cuft) per labourer or breaker
39. Breaking of brick ballast 25mm (1") gauge	0.55 cum	(20 cuft) per labourer or breaker
40. Breaking of stone ballast 40mm (1½") gauge	0.40 cum	(15 cuft) per labourer or breaker

LABOUR (MAZDOR) REQUIRED FOR DIFFERENT WORKS

Extracts from the report on productivity projects in building industries issued by National Building Organisation are given below

- (a) Earthwork per 28.30 cum (1000 cuft).
- (1) Excavation in foundations, trenches, etc. in ordinary soil including disposal up to 30m (100') and lift of 1.5m (5ft) - 5 Beldars and 4 Mazdoors can do 28.30 cum (1000 cuft) per day.
 - (2) Refilling excavated earth in foundations plinth, etc. including consolidation in 15cm (6") layers - 3 Beldars, 2 Mazdoors and ½ Bhisti can do 28.30 cum (1000 cuft) per day
 - (3) Disposal of surplus earth within a lead of 30m (100') - 1 Mazdoor can do 2.83 cum (100 cuft) per day.
- (b) Cement concrete work per 2.83 cum (100 cuft).
- Laying cement concrete - 2 Beldars, 3 Mazdoors, ¾ Bhisti and ¼ mason can do 2.83 cum (100 cuft) per day
- (c) R.C.C. work -
- (1) Laying reinforced concrete - 3 Beldars, 3 Mazdoors, 1½ Bhisti and ½ mason can do 2.83 cuft (100 cuft) per day
 - (2) Centering and shuttering for flat surfaces - 4 Beldars, and 1 carpenter (II class) can do 9.6 sqm (96 sqft) per day.
 - (3) Reinforcement work for R.C.C. - 1 Blacksmith or fitter and 1 Beldar can bend and place in position 1 quintal (2 cuft) of steel per day.
- (d) Stonework per 2.83 cum (100 cuft)
- Random rubble masonry with blue stone in foundations - 3 masons, 3 Beldar, 2 Mazdoors and ¼ Bhisti can do 2.83 cum (100 cuft) per day.
- (e) Brickwork per 2.83 cum (100 cuft) -
- First class brickwork in 1:4 cement mortar in superstructure partition walls, junctions of roofs parapet walls, and string course - 2½ masons, 4½ Mazdoors, and ½ Bhisti can do 2.83 cum (100 cuft) per day.
- (f) Woodwork -
- (1) For the frames of doors and windows - 2 carpenters and 1 Beldar can work 0.18 cum (60 cuft) of wood equivalent to 4 door frames 7.5m x 10cm or 1.2m x 2.1m (3' x 4" or 3' - 11" x 7") size per day
 - (2) For panelled, glazed, etc. shutters - 15 carpenters and 4 Beldars can make and fix 4 shutter 40cm thick of size 2.00m x 1.15m (1½" thick of size of 6' - 9" x 3' - 9") per day. Quantity of wood per shutter - 0.075 cum i.e. 2.66 cuft
- (g) Iron work -
- (1) Fixing 40mm x 3mm x 38cm (1½ x ½" x 15") flat iron holdbasts - 1 Blacksmith (II class) 1 mason, and 1 Beldar can fix 36 holdbasts per day.
 - (2) Fixing 16mm dia (5/8" dia) m.s. rods - 1 Blacksmith (II class), 2 carpenters (II class) and 3 Beldars can fix 16.5m (54 ft) per day.

(4) Flooring - 1 cm thick (1 1/2") thick cement concrete flooring of 40 sq.m (400 sq.ft) require - 5 masons, 4 Beldar, 3 Mazdoor and 1 Bhisti per day for mixing, laying and finishing.

(5) Finishing -
 (a) plastering with any mortar 12mm (1/2") thick - 3 masons, 3 Mazdoor and 1 Bhisti can plaster 40 sq.m (400 sq.ft) per day.
 (b) White washing or colour washing (3 coats) - 1 white washer and 1 Mazdoor can do 60 sq.m (600 sq.ft) per day.
 (c) Painting two coats such as chocolate, red, grey etc. on wood or steel - 3 painters and 2 Mazdoors can paint 10 sq.m (100 sq.ft) per day.

1 cu.m. portland cement (ordinary cement) = 1.44 grams i.e. 1 cu.m. of portland cement = 1440 kgs
 As per IS: 456 one litre (1 cu. decimeter) of portland cement = 1.44 kg
 1 cu.m. of portland cement = 30 bags for practical purpose.

1 bag cement of 50 kg = 1/30 cu.m. = 0.034 cu.m.

At Rs. 215.00 per bag the cost of 1 cu.m. of cement comes to Rs. 6325.00
 1 quintal (100 kg) white or stone lime

1 Lime concrete in foundation with 40mm gauge Brick Ballast unit 1 cu.m.
 Take - 10 cu.m.

(a) With white lime and surkhi 1:2 (proportion - 16:32:100, i.e. 1:2:6 approx)

Particulars	Qty or Nos.	Rate		Cost	
		Rs.	P.	Rs.	P.
Materials -

- (a) Rate per sqm for 10cm thick L.C. terracing = $1082.65/10 = \text{Rs. } 108.265$
- (ii) Rate per sqm for 7.5cm thick L.C. terracing = $1082.65/1.5 = \text{Rs. } 721.77$

Cement Concrete

Sum total quantity of determining the quantity of materials for 10 cum concrete is to divide 15.2 by the sum of the numerals of the proportions of the materials which gives the quantity of cement in cum.

Illustration - To find the materials for 10 cum. of cement of 1:4:8 proportion

cement = $\frac{15.2}{1+4+8} = \frac{15.2}{13} = 1.17 \text{ cu.m} = \text{say } 1.15 \text{ cu.m}$.

Therefore, sand = $1.15 \times 4 = 4.60 \text{ cu.m}$ and ballast = $1.15 \times 8 = 9.20 \text{ cu.m}$.

Materials required for different proportions of cement concrete - 10 cum.
Quantity of materials may be calculated by 15.2 as sum total and dividing by sum of the proportions

Proportion	Ballast	Sand	Cement
1:1 1/2:3	8.40 cum	4.20 cum	2.80 cum (24 bags)
1:2:4	8.80 cum	4.40 cum	2.20 cum (26 bags)

Brickwork with standard brick - Calculation of materials required for brickwork -

Take a wall 1/2 brick 30cm nominal thickness of 20m length and 5m height. Normally
 volume = 20 x 0.3 x 5 = 30 cum

Normally mortar joint will be less than 1cm, taking 1cm mortar joint, the actual thickness of wall be 29cm.

Therefore, actual volume = 20 x 0.29 x 5 = 29 cum. Number of standard bricks of 20cm x 10cm x 10cm nominal size = $\frac{29}{0.20 \times 0.10 \times 0.10} = 14500$ nos.

Therefore, number of bricks per cum (nominal) = $\frac{14500}{30} = 484$ nos. Considering 5% breakage, wastages, etc this may be taken 500 nos per cum.
 For 10 cum of brickwork 5000 bricks are required

Mortar - Mortar requirement = total volume of brickwork minus net volume of bricks = 30 - (10 x 0.09 x 0.09 x 14500) = 30 - 22.215 = 6.685 cum. For frog filling - for use of cut bricks bonding, for uneven joints, wastages, etc 15% extra mortar may be required. Therefore the volume of mortar = 6.685 + 6.685 x 0.15 = 7.688 cum. For dry volume increase by 1/4 dry volume of mortar = 7.688 + 1.922 = 9.61 cum.

For 30 cum of brickwork, dry volume of mortar = 9.61 cum.

For 10 cum of brickwork, dry volume of mortar = 9.61 x $\frac{10}{30} = 3.2$ cum.

In practice, for cement mortar 3 cum dry mortar and lime mortar 3.5 cum. taken

Calculation of materials of mortar -

Approximate method to determine the quantity of materials of mortar for 10 cum. brickwork. Divide 3 by the sum of the numerals of the proportion of materials which gives the quantity of cement in cum. As for example for brickwork in 1:6 cement mortar cement = $\frac{3}{1+6} = 0.43$ cum. Therefore sand = 0.43 x 6 = 2.58 cum. But as the cement will go to fill up the voids in sand 0.45 cum of cement and 2.7 cum. of sand may be taken.

I-class Brickwork in Foundation and plinth with 20x10x10cm (nominal size) Bricks with cement sand mortar 1:6 - unit 1 cum. Take - 10 cum.

PLASTERING

Calculation of quantity of mortar and materials -

Area \times thickness gives the quantity of mortar for uniform thickness. To fill up the joints and to make up uniform surface of wall, this may be increased by 30% which will give wet mixed mortar. To get the total dry volume of ingredient materials or mortar the wet volume may be further increased by 25%. The quantity of each material of the mortar may be found by usual methods, dividing the dry volume of mortar by the sum of the numerals of the proportion and multiplying by the individual numerals.

Materials for 12mm thick plastering in wall for 100 sq.m -

Wet mixed mortar for uniform layer = 1.2 cu.m . Adding 30% to fill up joints, uneven surfaces, etc. the quantity of mortar comes to $1.2 \times 1.3 = 1.56 \text{ cu.m}$. Increasing by 25% the total dry volume = 1.95 cu.m . For 1:6 cement sand mortar, Cement = $\frac{1}{1+6} = 0.143 \text{ cu.m}$, sand = $0.30 \times 6 = 1.80 \text{ cu.m}$. Similarly, the quantities of materials for other proportions may be calculated. The quantities of materials for different proportions are given in the following page.

Materials for 20mm thick plastering in wall for 100 sq.m -

As the thickness of plaster is more, 20% of mortar may be taken to fill up the joints, unevenness, etc. The quantity of wet mortar is equal to $2.00 \times 0.02 + 20\% = 2.00 + 0.40 = 2.40 \text{ cu.m}$. Increasing 25% the dry volume = $2.40 + 0.60 = 3.00 \text{ cu.m}$. The quantities of each material of mortar may be found by usual method.

Rich Mortar - For rich mortar plastering, the quantities of materials will be less as the cement will be in excess than the voids in sand and the reduction in volume of dry mortar will be less.

Ceiling plastering 12mm thick for 100 sq.m - For plastering in R.C. ceiling the unevenness of surface will be less and 20% extra mortar may be taken to get unevenness even surface. The quantity of wet mortar is equal to $100 \times 0.012 + 20\% = 1.2 + 0.24 = 1.44 \text{ cu.m}$. Increasing by 25% the dry volume = $1.44 + 0.36 = 1.80 \text{ cu.m}$.

For 6mm thick plastering R.C. ceiling the quantity of dry mortar may be taken as 1.00 cu.m .

For plastering in floor over lime concrete the same quantity of mortar as for wall may be taken as there will be sufficient unevenness in the surface of lime concrete.

Neat cement flooring - For neat cement finishing in floor or dado or skirting, the thickness of neat cement layer may be taken as 1.5mm ($\frac{1}{8}$) thick, therefore, the cement paste requirement for 100 sq.m = $100 \times 0.0015 = 0.15 \text{ cu.m}$. Dry volume of cement increased by 25% = $0.15 + 0.15 \times \frac{1}{4} = 0.19 \text{ cu.m} = 2 \text{ cu.m}$ (say) = 6 bag per 100 sq.m.

Materials required for plastering with different mortars of various proportions for 100 sq.m -

For 12mm thick plastering; total dry volume 2 cu.m -

Mortar	Proportion	Cement	Sand
(i) Cement mortar	1:2	0.60 cu.m (18 bags)	1.20 cu.m

Cement Concrete floor

The quantity of cement concrete may be calculated by multiplying area of floor thickness and the quantity of each material may be bound on the same principle as for cement concrete.

For 2.5 cm c.c. floor for 100 sq.m. of area the quantity of cement concrete = $100 \times 0.025 = 2.5 \text{ cu.m}$. Adding 10% extra for unevenness of base concrete, the quantity comes to $2.5 + 0.25 = 2.75 \text{ cu.m}$.

For 100 cu.m cement concrete the total dry volume of materials is 125, i.e. approximately 50% more.

For 2.5 cm thick c.c. floor of 1:2:4 proportion, for 100 sq.m total dry volume of materials = $2.75 + 50\% = 2.75 + 1.375 = 4.125 \text{ cu.m}$. Therefore, cement = $\frac{4.125}{1+2+4} \times \frac{4.125}{7} = 0.59 \text{ cu.m} = 0.60 \text{ cu.m}$ (12 bags), sand = $0.6 \times 2 = 1.20 \text{ cu.m}$ and stone aggregate = $0.6 \times 4 = 2.40 \text{ cu.m}$. For neat cement surface finishing additional 0.2 cu.m (6 bags) of cement will be required.

For 2 cm thick c.c. floor of 1:1½:3 proportion for 100 sq.m. the dry volume of materials as above is equal to 4.125 cu.m. Therefore, cement = $\frac{4.125}{1+1\frac{1}{2}+3} = 0.75 \text{ cu.m} = 22.5 \text{ bags}$, quantity of sand = $0.75 \times 1\frac{1}{2} = 1.125 \text{ cu.m}$, and the quantity of stone aggregate = $0.75 \times 3 = 2.25 \text{ cu.m}$. For neat cement finishing add extra cement of 0.2 cu.m (6 bags).

For 4 cm thick c.c. 1:2:4 floor 100 sq.m., total dry volume of concrete = $100 \times 0.04 + 10\%$ (for unevenness) + 50% increase for dry volume = $4.4 + 2.2 = 6.6$ = 6.6 cu.m. Therefore, cement = $\frac{6.6}{1+2+4} = 0.94 \text{ cu.m}$ (28.2 bags), sand = $0.94 \times 2 = 1.88 \text{ cu.m}$ and stone aggregate = $0.94 \times 4 = 3.76 \text{ cu.m}$. For neat cement finishing add extra cement of 0.2 cu.m (6 bags).

For coloured cement floor, mix pigment colour with neat surface cement in the proportion of 1:3 to 1:6 (colour: cement) to have the desired colour. White cement mixed with colour pigment of the desired proportion may also be used, but for strength it is better if ordinary portland cement is mixed with white cement in the proportion of 1:1 to 1:3 (grey portland cement: white cement) and then to add colour pigment to have the desired colour.

When colour pigment is mixed with white cement, the quantity of colour pigment is much less, may be 1:5 to 1:10 (pigment: white cement).

Calculation of materials for Mosaic Terrazzo floor for 100 sq.m -
 20mm thick C.C. 1:2:4 - Volume of C.C. - 100 x 0.02 + 10% for uneven and rough base = 2.00 + 0.20 = 2.20 cu.m. Dry volume = 2.20 x 1.50 = 3.30 cu.m. cement = $\frac{3.3}{1+2+4} = 0.47$ cu.m. (11 bags)

sand = $0.47 \times 2 = 0.94$ cu.m.
 stone chips = $0.47 \times 4 = 1.88$ cu.m.

6mm Mosaic Layer 1:1½ = Volume of mosaic concrete
 = 100 x 0.006 + 20% for surface cutting
 by rubbing = 0.60 + 0.12 = 0.72 cu.m.
 Dry volume = 0.72 + 50% = 0.72 + 0.36 = 1.08 cu.m.

cement = $\frac{1.08}{1+1\frac{1}{2}} = \frac{1.08}{2\frac{1}{2}} = 0.4$ cu.m (12 bags)

Marble chips = $0.4 \times 1\frac{1}{2} = 0.60$ cu.m.

Materials for mosaic layer for different proportions -

- (i) Proportion 1:1 - Cement = 0.50 cu.m (15 bags), Marble chips = 0.5 cu.m.
- (ii) Proportion 1:1½ cement = 0.40 cu.m (12 bags), marble chips = 0.6 cu.m.
- (iii) Proportion 1:2 - Cement = 0.36 cu.m (10.8 bags), marble chips = 0.72 cu.m.
- (iv) To get whitish base (ground) 10% to 20% of marble dust may be mixed with portland cement.

Mosaic Dado or skirting - 6mm thick mosaic layer over 20mm thick cement plaster 1:3 cement: coarse sand. Materials for cement mortar same as in para 49c. Materials for mosaic layer to be same as above. Labour may be increased by 10% over 100 sq.m.

Brick Floor 10cm thick surface pointed with cement mortar -

Requirement of materials for 100 sq.m. - Brick floor 10 cm thick 100sqm is equal to $100 \times 0.10 = 10 \text{ cum}$. Hence materials requirement is same as for 10 cum brickwork but 10% excess mortar may be taken for unevenness of base. For pointing 0.6 cum total dry mortar is required. For brick floor laid with 1:6 cement mortar the quantity of materials are - Brick = 5000 nos, cement = 0.5 cum (15 bags) and sand = 3.0 cum. For pointing 1:2 - cement = 0.2 cum (6 bags) and sand = 0.4 cum are required. Similarly, materials for other proportions may be calculated.

42. Brick Floor 10cm thick cement pointed - unit 1 sqm. Take - 100 sq.m

Lead and Lift:- Normally earthwork is estimated for 30 m lead for distance and 1.5 m lift for height or depth, and this distance of 30 m and the height of 1.5 m are known as normal lead and lift. Normal rate for earthwork is for 30 m lead and 1.5 m lift. For greater lead or lift the rates will be different for every unit of 30 m lead and for every unit of 1.5 m lift. The earthwork is, therefore, estimated separately for every 30 m lead and for every 1.5 m lift.

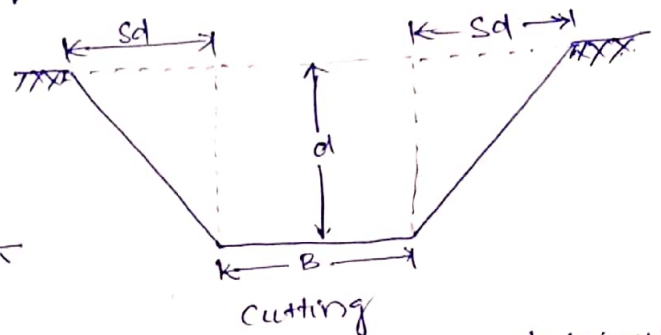

For the calculation of earthwork in a road longitudinal section and cross-section of the ground are taken and the formation line is fixed. The formation line is fixed in consideration of bleed level gradient, height of bank, depth of cutting, etc. In plain countries road is usually in banking, but if the road is in cutting for some length and in banking for some other length, the excavated earth from the cutting portion should be utilised for the banking portion within economical limits, during the execution of the work. But for estimating of earthwork this point of utilising excavated earth from cutting in certain length in banking of the adjacent may not be taken into account to avoid complicity. In hilly countries road is usually both in banking and in cutting and the excavated earth from cutting is utilised for banking within economical limits.

Calculation of lead & lift

Cross-section of earthwork of road in banking or in cutting is usually in the form of trapezium, and the quantity of earthwork may be calculated by the following methods:-

Banking

Cutting

Sectional area = Area of central rectangular portion + Area of two side triangular portions.

$$= Bd + 2(\frac{1}{2}sd \times d) = Bd + sd^2$$

S:1 is the ratio of side slopes as horizontal:vertical. For 1 vertical, horizontal is S. For d vertical, horizontal is sd.

$$\text{Quantity} = (Bd + sd^2) \times L$$

When the ground is in a longitudinal slope, the height of bank or the depth of cutting will be different at the two ends of the section, and mean height or depth may be taken for "d" and sectional area at mid-section is taken out for mean height. Alternatively, sectional area at the two ends may be calculated and the mean of two sectional area is taken out. Sectional area at the mid-section or the mean sectional area, multiplied by the length gives the quantity.

$$\text{Mean height} = \frac{d_1 + d_2}{2}$$

Different kinds of soil as sandy, clayey, rocky etc. estimated separately as the rates vary.

Quantity of earthwork may be calculated by the various methods of measurement out of which three methods are given

Method I. Mid-sectional Area Method: Quantity = Area of mid-section \times length. Let d_1 and d_2 be the height of bank at two ends portion of embankment, L the length of the section, B the formation width and S:1 (horizontal:vertical) the side slope, then

Area of mid section = Area of rectangular portion + area of two triangular portion,
 $= Bd + \frac{1}{2}sd + \frac{1}{2}sd = Bd + sd$

\therefore Quantity of earthwork = $(Bd + sd) \times L$

General, $Q = (Bd + sd^2) \times L$, where d stands for mean height or depth,

The quantities of earthwork may be calculated in a tabular form as below.

Station or chainage	Depth or Height	Mean Depth or Height d	Area of central portion Bd	Area of sides sd^2	Total sectional Area $Bd + sd^2$	Length between stations L	Quantity (cft) $\times L$	
							Embankment	Cutting

Area of side sloping surface —

The area of sides which may require turbing or pitching, may be found by multiplying the mean sloping breadth by the length.

The mean sloping breadth = $\sqrt{(sd)^2 + d^2} = d\sqrt{s^2 + 1}$, where d stands for mean d .

Area of both side slopes = $2L \times d \times \sqrt{s^2 + 1}$

This also may be calculated in a tabular form —

Station or chainage	Depth or Height	Mean depth or Height	Breadth of side slopes $d\sqrt{s^2 + 1}$	Length between stations L	Total Area of both side slopes $2Ld\sqrt{s^2 + 1}$

Method II - Mean Sectional Area Method:

Quantity = Mean sectional area \times length,
 sectional area at one end $A_1 = Bd_1 + sd_1^2$, sectional area at the other end $A_2 = Bd_2 + sd_2^2$, d_1 and d_2 are the heights or depths at the two ends.

The mean sectional area $A = \frac{A_1 + A_2}{2}$, Quantity $Q = \frac{A_1 + A_2}{2} \times \text{Length}$.

The quantities of earthwork may be calculated in a tabular form as given below:

Stations or chainage	Height or Depth d	Area of central portion Bd	Area of sides sd^2	Total sectional Area $Bd + sd^2$	Mean sectional Area	Length between stations L	Quantity (cft) $\times L$	
							Embankment	Cutting

Method III Prismatic Formula method: Quantity or volume = $\frac{L}{6} (A_1 + A_2 + 4A_m)$

Where A_1 and A_2 are the cross-sectional areas at the two ends of a portion of embankment of a road of length L , and A_m is the mid-sectional area.

Let d_1 and d_2 be the heights of banks at the two ends, and d_m be the mean height at the mid section, B be the bottom width and $s:1$ be the side slope,

Cross-sectional area at one end — $A_1 = Bd_1 + sd_1^2$

cross sectional area at one end -

$$A_1 = Bd_1 + sd_1^2$$

cross-sectional area at other end -

$$A_2 = Bd_2 + sd_2^2$$

cross-sectional area at middle -

$$d_m = \frac{d_1 + d_2}{2}$$

$$A_m = Bd_m + sd_m^2 = B\left(\frac{d_1 + d_2}{2}\right) + s\left(\frac{d_1 + d_2}{2}\right)^2$$

$$\text{Quantity} = \frac{L}{6} (A_1 + A_2 + 4A_m)$$

$$= \frac{L}{6} \left[(Bd_1 + sd_1^2) + (Bd_2 + sd_2^2) + 4\left\{ B\left(\frac{d_1 + d_2}{2}\right) + s\left(\frac{d_1 + d_2}{2}\right)^2 \right\} \right]$$

$$= \frac{L}{6} \left[(Bd_1 + Bd_2 + 4\frac{Bd_1}{2} + 4\frac{Bd_2}{2}) + (sd_1^2 + sd_2^2 + 4s\frac{d_1^2 + d_2^2 + 2d_1d_2}{4}) \right]$$

$$= \frac{L}{6} [3Bd_1 + 3Bd_2 + 2sd_1^2 + 2sd_2^2 + 2sd_1d_2]$$

$$= \frac{3BL}{6} (d_1 + d_2) + \frac{2Ls}{6} (d_1^2 + d_2^2 + d_1d_2)$$

$$= \frac{BL}{2} (d_1 + d_2) + \frac{Ls}{3} (d_1^2 + d_2^2 + d_1d_2)$$

$$= \left\{ B\left(\frac{d_1 + d_2}{2}\right) + s\left(\frac{d_1^2 + d_2^2 + 2d_1d_2}{3}\right) \right\} \times L$$

$$= [\text{Sec. Area of central portion} + \text{Sec. Area of side slope portions}] \times \text{Length.}$$

Ex. 1 Calculate the quantity of earthwork for 200 metre length for a portion of a road in on uniform ground the heights of banks at the two ends being 1.00m and 1.60m. The formation width is 10 metre and side slope 2:1 (Horizontal:vertical). Assume that there is no transverse slope.

By method I

$$\text{Quantity} = (Bd + sd^2) \times \text{Length}$$

$$= (10 \times 1.3 + 2 \times 1.3^2) \times 200$$

$$= (13 + 3.38) \times 200$$

$$= 16.38 \times 200 = 3276 \text{ cu.m.}$$

$$B = 10\text{m}, s = 2, L = 200\text{m}$$

$$d = \text{mean depth}$$

$$= \frac{1.00 + 1.60}{2} = 1.30\text{m}$$

By method II -

$$A_1 = \text{sec. area at one end} = Bd_1 + sd_1^2 = 10 \times 1 + 2 \times 1^2 = 12 \text{ sq.m.}$$

$$A_2 = \text{sec. area at other end} = Bd_2 + sd_2^2 = 10 \times 1.60 + 2 \times 1.6^2 = 21.12 \text{ sq.m.}$$

$$A_m = \text{mid. sec. area}$$

$$= Bd_m + sd_m^2 \text{ where } d_m = \frac{d_1 + d_2}{2} = \frac{1.00 + 1.60}{2} = 1.30\text{m}$$

$$= 10 \times 1.30 + 2 \times 1.30^2 = 16.38 \text{ sq.m.}$$

$$\therefore \text{Quantity} = \frac{200}{6} (12 + 21.12 + 4 \times 16.38) = \frac{200}{6} \times 98.64$$

$$= \frac{19728}{6} = 3288 \text{ cu.m.}$$

Ex. 2 (i) Calculate the area of the side slopes of portion of a bank for a length of 200 metre the heights of banks at the two ends being 2.50m and 3.50m and the ratio of the side slope 2:1.

(ii) If the side slopes are to be provided with 15cm thick stone pitching, calculate the cost of pitching at the rate of Rs. 150/- per cu.m.

$$(i) \text{ Mean height } d = \frac{2.5 + 3.5}{2} = 3\text{m}$$

$$\text{sloping breadth at the mid-section} = d\sqrt{(s^2 + 1)} = 3\sqrt{(2^2 + 1)} = 6.71$$

$$\text{Area of the two side slopes} = 2L \times d\sqrt{(s^2 + 1)} = 2 \times 200 \times 6.71 = 2684 \text{ sq.m.}$$

(ii) Quantity of pitching = Area \times thickness = $2684 \times 0.15 = 402.6$ cum.
Cost of stone pitching = $402.6 \times 150.00 = \text{Rs. } 60390.00$

Conveyance Allowance:

When the duty of a government servant is such that it requires extensive travelling at or within a short distance from his headquarters for which no travelling allowance is ordinarily admissible, and he maintains a conveyance for efficient discharge of his official functions, a Conveyance Allowance per month is granted by the competent authority. The conveyance may be a car, a motor cycle, or a cycle according to the class of officer, and the allowance is meant for the maintenance and up keep of the conveyance. In the monthly bill a certificate to the effect that the type of conveyance is maintained in a satisfactory condition is to be given. If the officer travels longer distance and draws travelling allowance kilometre (mileage) basis, then his monthly conveyance allowance for that day should be deducted. If the duties of the government is such that he is required to maintain a horse, the conveyance granted to him is known as Horse Allowance.

Conveyance charges means the charges made by the Licensee for the conveyance of gas, "conveyance services" means all services provided by the Licensee of conveying gas to through and within the Licensed Area. "Formula Year" means a year commencing on 1st January. "Network Code" means the network code as prepared by the Licensee.

Conveyance charges means the stamp duty and the registration charges as per provision of the Applicable Law and all incidental and legal costs and expenses for preparation and execution of the Sub-Lease Deed for the transfer of ownership of the Apartment in favour of the Applicant upon completion/Part completion of the Apartment and clearance of all dues in terms hereof to the company.

Royalty charge: A royalty charge is a payment that a licensee makes to a licensor in exchange for the use of their licensed asset. In construction, this asset could be a new technology, product, system, material or design, perhaps incorporating intellectual property assets like patents, know-how and trademarks.

Royalty charges are usually agreed as a percentage of sales generated by the licensee asset. In some circumstances, they are set as a fixed price. Royalty are charged on an ongoing basis.

The amount that the licensee must pay is outlined in a royalty agreement. This agreement also specifies how the licensee may use the licensed asset where they can use it and for how long.

Abstract cost of estimate

The cost of each item of work is calculated in a tabular form from the quantities already computed and total cost is worked out in Abstract of Estimate form. The rates of different items of work are taken as per schedule of rates or current workable rates or analysed rates for finished items of work. A percentage usually 3% of the estimated cost is added to allow for contingencies for miscellaneous petty items which don't come under any classified head of items of work and a percentage of about 2% is provided for work charge of establishment. The Grand Total thus obtained gives the estimated cost of work.

The detailed estimate is usually prepared work-wise, under each sub-work as main building, servants quarters, garage, boundary walls, etc.

The detailed estimate is accompanied with:

- (1) Report
- (2) General specifications
- (3) Detailed specifications
- (4) Drawings: plan, elevation, sectional elevations, detailed drawings, site plan or layout plan or index plan etc.
- (5) Calculation and designs - Design of foundation, beam, slab, lintel, design of channel in case of irrigation channel, design of thickness of metal trust in case of road etc.
- (6) Analysis of rates, if rates are not as per schedule of rates or for the non-scheduled items.

Valuation :- Valuation is the technique of estimating or determining the fair price or value of a property such as a building, a factory, other engineering structure of various types, land, etc. By valuation the present value of a property is determined. The present value of property may be decided by its selling price, or income or rent it may fetch. The value of property depends on its structure, life, maintenance, location, bank interest, legal control, etc. The value also depends on supply and demand and the purpose for which valuation is required.

Cost means original cost of construction or purchase, while value means the present value (saleable value) which may be higher or lower than the cost. A building whose cost of construction is ₹. 50,000.00, when put for sale may fetch ₹. 60,000.00 this sale price is the value of the building. Similarly, the value may be less than the original cost.

Purpose of valuation:- The main purpose of valuation are as follows

- (i) Buying or Selling Property:- When it is required to buy or to sell a property, its valuation is required.
- (ii) Taxation - To assess the tax of a property its valuation is required. Taxes may be Municipal Tax, Wealth Tax, Property Tax, etc. and all the taxes are fixed on the valuation of the property.
- (iii) Rent fixation:- In order to determine the rent of a property, valuation is required. Rent is usually fixed on certain percentage of the amount of valuation (5% to 10% of the valuation).
- (iv) Security of loans or Mortgage:- When loans are taken against the security of the property, its valuation is required.
- (v) Compulsory acquisition:- Whenever a property is acquired by law compensation is paid to the owner. To determine the amount of compensation valuation of the property is required.
- (vi) Valuation of a property is also required for Insurance, Betterment charges, Specifications, etc.

Cost is the amount incurred in producing and maintaining the product. Value is the utility of a good or service for a customer. By valuation the present value of a property is determined. The present value of property may be decided by its selling price, or income or rent it may fetch. The value of property

depends on its structure, life, maintenance, location, bank interest etc. Cost means original cost of construction or purchase.

Scrap value: Scrap value is the value of dismantled materials. For a building when the life is over at the end of its utility period the dismantled materials as steel, bricks, timber, etc. will fetch a certain amount which is the scrap value of the building. In the case of machine the scrap value is the value of the metal only or the value of the dismantled parts. The scrap value of a building may be about 10% of its total cost of construction. The cost of dismantling and removal of the rubbish material is deducted from the total receipt from the sale of the useable materials to get the scrap value.

Salvage value: It is the value at the end of the utility period without being dismantled. A machine after the completion of its usual span of life or when it become uneconomic may be sold and one may purchase the same for use for some other purpose the sale value of the machine is the salvage value. It does not include the cost of removal, sale, etc.

Normally, the scrap value, or the salvage value of a property or an asset has got some positive figure, but it may also be zero or negative. As for example the scrap value of a building will be negative as dismantling and removal will be costly.

Assess value: For the purpose of taxation, a property is assessed for its monetary worth. This ascertained price is known assessed value.

This assessment is done at an annual basis, considering factors such as property values and market conditions in neighboring areas. Governmental agencies like Municipal Corporation conduct this assessment for measuring applicability of property taxes based on the monetary value of the property.

Insurance companies may not use these valuations for indemnification etc. In general, this assessed value tends to be less than the fair or actual market price of the property.

Sinking fund: The fund which is gradually accumulated by way of periodic or annual deposit for the replacement of the building or structure at the end of its useful life, is termed as sinking fund. The object of creating sinking fund is to accumulate sufficient money to meet the cost of construction or replacement of the building or structure after its utility period. The sinking fund is created by regular annual or periodic deposits in compound interest bearing investment, which will cover the amount of replacement at the end of the utility period of the property. The sinking fund may be created by taking a sinking fund policy with an insurance company or by depositing in bank to collect highest compound interest. The calculation of sinking fund depends on the life of the building and scrap value of the building or the cost of old materials. The cost of land is not taken into account in calculating sinking fund as land remains intact.

The sinking fund may also be required for payment of loan, if a property is owned or constructed by taking loan a sinking fund may be created by setting a sum of money annually to accumulate with compound interest in order to repay the debt at the end of the term of loan. The amount thus set aside is also known as Annuity payment. The amount which will be set aside may also be paid directly to lender by way of annual instalment. The amount of annual instalment of the sinking fund may be found out by the formula.

$$I = \frac{S \cdot i}{(1+i)^n - 1}$$

where S = total amount of sinking fund to be accumulated,
 n = number of years required to accumulate the sinking fund
 i = rate of interest in decimal (e.g. 5% = 0.05), and I = annual instalment required

Ex. 1 A pumping set with a motor has been installed in a building at a cost of Rs. 2,500.00. Assuming the life of the pump as 15 years, work out the amount of annual instalment of sinking fund required to be deposited to accumulate the whole amount of 4% compound interest.

$$\text{The annual sinking fund } I = \frac{S_i}{(1+i)^n - 1} = \frac{2500 \times 0.04}{(1+0.04)^{15} - 1} = 2500 \times 0.05 = \text{Rs. } 125$$

The owner is to deposit Rs. 125/- annually in 4% compound interest carrying investment for 15 years to accumulate Rs. 2,500/-

Ex. 2 An old building has been purchased by a person at a cost of Rs. 30,000/- excluding the cost of the land. Calculate the amount of annual sinking fund at 4% interest assuming the future life of the building as 20 years and the scrap value of the building as 10% of the cost of purchase.

The total amount of sinking fund to be accumulated at the end of 20 years,

$$S = 3000 \times \frac{90}{100} = \text{Rs. } 27,000.00$$

$$\text{Annual instalment of sinking fund } I = \frac{S_i}{(1+i)^n - 1} = \frac{27000 \times 0.04}{(1+0.04)^{20} - 1}$$

$$\text{Annual instalment for sinking fund required} = 27000 \times 0.0336 = \text{Rs. } 907.20$$

Depreciation:- Depreciation is the gradual exhaustion of the usefulness of a property. This may be defined as the decrease or loss in the value of a property due to structural deterioration, use, life wear and tear, decay and obsolescence. The value of a building or structure will be gradually reduced due to its use, life, wear and tear etc. and a certain percentage of the total cost may be allowed as depreciation to determine its present value. Usually a % on depreciation per annum is allowed. The general annual rate of depreciation is known as annual depreciation. Usually, the percentage rate of depreciation is less at the beginning and gradually increases during later years.

The amount of depreciation being known, the percentage value of a property can be calculated after deducting the total amount of depreciation from the original cost.

Method of calculating depreciation:- The various methods of calculating depreciation are as follows:-

- 1) straight line method
- 2) Constant percentage method
- 3) sinking fund method
- 4) Quantity survey method

In all these methods, it is necessary to decide the economic or effective life of the property.

(1) straight line method:- In this method it is assumed that the property loses its value by the same amount every year. A fixed amount of the original cost is deducted every year, so that at the end of the utility period only the scrap value is left.

$$\text{Annual depreciation } D = \frac{\text{Original cost} - \text{Scrap value}}{\text{Life in year}} = \frac{C - S}{n}$$

where C - original cost, S - scrap value, n - life of the property in years and D - annual depreciation. The book value after the number of years, say N years = original cost - NXD.

(2) Constant percentage method or Declining balance method:-

In this method, it is assumed that the property will lose its value by a constant percentage of its value at the beginning of every year.

$$\text{Annual depreciation, } D = 1 - \left(\frac{S}{C}\right)^{1/n}, \text{ where } C, S, n \text{ and } D \text{ have the same meaning as above}$$

The value of the property or the depreciated cost at the end of the first year

$$= C - DC = C_1$$

The value of the property at the end of the 2nd year = $C_1 - DC_1$ and so on

The value of the property or the depreciated cost at the end of the n years

$$= C \left(\frac{s}{1-s} \right)^n$$

The formula will fail when $s=0$. When the ratio $\frac{s}{1-s}$ is very small, the depreciation over the first year will be considerable.

(2) Sinking fund method: In this method the depreciation of property is assumed to be equal to the annual sinking fund plus the interest on the fund over that year, which is supposed to be invested on interest bearing investments. If A is the annual sinking fund and a, b, c, d, \dots represents interest on the sinking fund over subsequent years, and $C =$ total original cost, then —

At the end of	Depreciation over the year	Total depreciation	Book value
1st year	A	A	$C - A$
2nd year	$A + b$	$2A + b$	$C - (2A + b)$
3rd year	$A + c$	$3A + b + c$	$C - (3A + b + c)$
4th year	$A + d$	$4A + b + c + d$	$C - (4A + b + c + d)$
			so on ...

(3) Quantity survey method: In this method the property is studied in detail and loss in value due to life, wear and tear, decay, obsolescence, etc. worked out. Each and every step is based on some logical ground without any fixed percentage of the cost of the property. Only experienced valuers can work the amount of depreciation and present value of a property by this method.

Obsolescence: The value of property or structures becomes less by its becoming out of date in style in structure in design, etc. and this is termed as obsolescence. An old dated building with massive walls, arrangements of rooms not suited in present days and other similar reasons, becomes obsolete even if it is maintained in a very good condition and its value becomes less due to obsolescence. The obsolescence may be due to the reasons such as progress in arts, change in fashions, changes in planning ideas, new inventions, improvements in design technique, etc. A machine of old design may become obsolete, though it may be in good running condition and its value will be less. Thus, though the property is physically sound, it may become functionally inadequate and its economical return becomes less.

Administrative set up and hierarchy of Engineering Department in different level.

Office of the Engineer-in-charge (Civil):-

This is the head of department office and functioning under Government of Odisha, Works Department. There are ten Circle offices (Seven Civil, one P.H., one electrical and one mechanical) functioning under this Organization. There are 36 Civil Divisions and 2 S.P.H. Division, 4 General Medical Divisions and 4 Mechanical Divisions are functioning under the above Circle offices, sub-Divisional offices and section offices are also functioning under the above Divisional offices.

The Engineer-in-charge (Civil) is the head of the Organization. Three chief Engineers designated as chief Engineer, (DPI & Roads), chief Engineer, Buildings and chief Engineer, World Bank are functioning under the office.

Design, planning and Investigation & Roads

The Design and planning activity in the organization is provided through a separate Design, planning and Investigation Wing in the Odisha Works Department. Its head the chief Engineer, Design, planning and Investigation and Road (CE(DP&R)) has a reporting responsibility to the EIC-cum-Secretary.

Buildings:

In addition to responsibilities for roads, Odisha works department has the task of supervising the construction and maintenance of public buildings on behalf of a wide range of state Government Organizations. For this purpose, the organization structure of Odisha works department includes a specific wing devoted to this activity. It is headed by a chief Engineer Buildings (CE(B)) reporting to the EIC-cum-Secretary.

World Bank Project:

Odisha State Road Project (O.S.R.P.) is a World Bank funded project implemented by Works Department (OWD) of 6100. The project Development objective (PDO) is to remove transport bottlenecks in targeted transport corridors for greater investment and economic and social development activities in the states of Odisha. The project Management Unit (PMU), headed by chief Engineer (WBP) is located at Nirman South, Unit-5, Bhubaneswar.

National Highways:

Responsibility for new construction and maintenance works on the National Highway is under the control of the chief engineer national highways (CE NH). The CE (NH) reports to MOST for works carried out on the National Highway network.

Research Development and Quality Promotion

Inspection and Quality Control activity is under the control of the chief Engineer Research Development and Quality Promotion (CE(RD&QP)). It was established as a Research Laboratory in 1965 to cater to the need for testing of materials involved in road and building construction. This wing's functions expanded in 1982 to include a research development and quality promotion cell.

Odisha Bridge Construction Corporation

Odisha Bridge & Construction Corporation Limited (OB&CC) was incorporated on 01.01.1983 under Companies Act, 1956 as a Govt. Company. It is a Government Company sponsored by Odisha state Government within the meaning of section 617 of the Companies Act. Since its inception, it is working as a Govt. of Odisha undertaking organization. The corporation is governed by Managing Director on behalf of Board of Director nominated by the Govt. under guidelines set by Memorandum of Association and articles of Association along with work rules mentioned therein.

Office of the chief Architect:

The office of the chief Architect is working as an independent Head of Department under the administrative control of Works Department and looks after the architectural works matters of the state of Odisha. Besides the above, the said office also prepares architectural project drawing for Works Department and also for other Department. This wing is headed by EC (Architect)

State Procurement Cell

With the objective of supervision of full roll out of e-procurement in the State Engineering Department of the State, Government have constituted the "State Procurement Cell" under the administrative control of works department with Lt C. Govil, Odisha as the chief procurement officer and works Department on. to start dt. 06.05.2020. This wing is headed by chief Engineer cum chief Manager (Tech) of the State Procurement Cell, Govt. of Odisha.

Duties responsibility of chief engineer:

- Communicating the goals of the company to all engineers and professional in the team.
- Supervising every phase of the project from start to completion
- Calculating costs, material, labour, and time required for each project.
- Approving design and budgets
- Delegating tasks to engineering teams
- Supervising staff training as well as equipment installation.
- Performing quality control checks on all systems and products
- Quickly resolving disputes between staff
- Acknowledging or rewarding good work.
- Analyzing data and drafting reports for review.

Duties and responsibility of the Junior Engineers

- To keep detail history of all roads, culverts bridges and building which belong to his jurisdiction along with flow of road, conditions of roads, bridges, culverts & buildings.
- To maintain a register with the work which was executed over the roads, bridges, culverts and building premises or any other structure with relevant data like, Mouza Map, Right of way for road stretches, Road furniture, trees, schemes as well as technical details of the asset, as-built drawings, nature of any work executed over the asset or its portion, date of completion of the work, end date of defect liability period (DLP) according to the contract for said work, condition of the asset during defect liability period Name of agency with his contract reference. This register will be road wise/building wise. He is to update asset register on regular basis keeping all relevant drawings linked with the asset in safe custody.
- To inspect every road/bridge/culvert/building on periodic basis. He should maintain a register to keep record as per his inspection and observation. For road stretches this inspection will be bi-weekly basis during monsoon period. If he observes any irregularities as and when identified.
- To watch whether any unlawful matters including encroachment are going on the roads or building premises. If he observes it, he should take suitable steps towards it and inform to his higher authority.
- To prepare all the preliminary & detailed estimates for original works, periodical maintenance, addition and alteration as well as modernization as directed by his higher authorities, inclusive of scheduled & Non schedule items with proper analysis of rates, rough drawing, site plan by collecting engineering data and drawings and submit those estimates to his immediate superior authority for approval from competent authority.
- To supervise and see that all works under his charge are done according to the specifications, drawings, standards by down in contract agreement, tender schedule of work and approved samples by engineers in charge. He is expected to remain at site throughout in order to see that the works are executed properly in accordance with the requirements, standards and approved samples. It is the duty of the Junior Engineer to bring it at once to the notice of immediate superior authority and also make a note in the site order book if any work is not done by a Contractor maintained

disputable period, specifications, requirements, drawings, standards laid down and approved samples including quality of materials.

- To take the level of areas where earthwork or similar type of work is under execution and prepare volumetric calculation sheets for quantitative analysis and load change, etc.
- To carry out test of materials like cement, steel, bitumen, metal, wood, soil, aggregate or any other materials as directed by higher authorities and item of work as specified in contract agreement of works, maintain register of testing of each and every item separately and place to his immediate superior authority to make a note in the register.
- To arrange and issue materials, T & P to contractor/works at the proper time so that there is no obstruction in the execution of work.
- To keep Government materials, T & P in his custody and care, maintain proper accounts of receipts, issues and balances, arrange adequate watch and ward.

Duties of Assistance Engineer:

- Designing construction projects by studying project concept, architectural drawings and models.
- Preparing engineering design by collecting and studying reports, maps, drawings, blueprints, aerial photographs and tests on soil composition, terrain, hydrological characteristics and related topographical and geologic data.
- Determining project costs by calculating labor, material, and related costs.
- Preparing feasibility study by analyzing engineering design, conducting environmental impact studies, assembling data.
- Preparing engineering documents by developing construction specifications, plans and schedules.
- Resolving design and development problems.
- Managing budgets and project resources.
- Scheduling material and equipment purchases and deliveries.
- Making sure the project complies with legal requirements, especially health and safety.
- Confirming adherence to construction specifications and safety standards by monitoring project progress, inspecting construction site, verifying calculations and placements.
- Fulfilling project requirements by training and guiding operators.
- Maintaining operations by enforcing project and operational policies and procedures.
- Providing engineering information by answering questions and requests.
